**Technical Memorandum** 

April 16, 2025

## Cal Poly Humboldt Siemens Hall – Asbestos and Lead Data Summary

## XPL311 – Siemens Hall Roof Replacement Project

The California State Polytechnic University, Humboldt (Humboldt) Facilities Management (FM) Planning, Construction & Design (PDC) division collected bulk samples of suspect Asbestos Containing Material (ACM) and suspect lead materials at the Siemens Hall (SH) exterior roof on March 11, 2025.

This memorandum summarizes the sampling survey analytical findings and provides conclusions based on these data. The location of samples collected at the SH roof are depicted on the attached Sample Location Map (Figure 1, Attachment A). Photographs of the project site are attached (Attachment B).

## **Site Description**

The Siemens Hall (Building 001) is located at the following street address:

• 239 Plaza Mall, Arcata, CA 95521

The SH is a two-level reinforced concrete building located in the center of the Humboldt campus. The SH was constructed in 1959 and is currently utilized by Humboldt administration and academic programs for administrative and instructional purposes. The roof of SH, including the southwest entry lower roof, consists of a bituminous built-up roofing system installed over layers of cellulose and foam insulation. The SH roof deck is concrete. Roof penetrations are sealed with mastic.

### **Survey Description**

A total 14 suspect ACM samples were collected throughout the SH roof, some samples consisting of multiple unique layers of material. The bulk samples collected at the SH roof are listed in Table 1 (page 2). The sample locations are shown on Figure 1 (Attachment A).

The ACM sampling was conducted in general conformance with the United States Environmental Protection Agency (USEPA) National Emission Standards for Hazardous Air Pollutants (NESHAP) regulations governing facility renovation.

Sampling was conducted by Scott Harris, a FM PDC California Department of Industrial Relations, Division of Occupational Safety and Health (Cal/OSHA) Certified Asbestos Consultant (11-4713) and California Department of Public Health Lead Inspector/Assessor (LRC-00004068).

## Laboratory Data

Bulk samples collected from SH were sent to EMSL Analytical Inc. (EMSL), an accredited laboratory located in San Leandro, California. Suspect ACM samples were analyzed for asbestos content via

1 Harpst Street, Arcata, California 95521-8299 facilitymgmt.humboldt.edu

THE CALIFORNIA STATE UNIVERSITY · Bakersfield · Channel Islands · Chico · Dominguez Hills · East Bay · Fresno · Fullerton · Humboldt · Long Beach · Los Angeles · Maritime Academy Monterey Bay · Northridge · Pomona · Sacramento · San Bernardino · San Diego · San Francisco · San Jose · San Luis Obispo · San Marcos · Sonoma · Stanislaus Asbestos and Lead Data Summary Cal Poly Humboldt – Siemens Hall Roof

Polarized Light Microscopy (PLM) using USEPA Method 600/R-93-R. Suspect LBP samples were analyzed for lead content via Atomic Absorption Spectrometry (AAS) using USEPA Method 3050B/7000B. The PLM and AAS analytical reports are attached (Attachment C).

## **Asbestos Findings**

The PLM data for samples collected at SH are summarized in Table 1 (below). Table 1 includes the location, material type, analytical result, and applicable regulatory designations for each sample. Samples that do not contain asbestos above the PLM laboratory detection limit are reported as non-detect (ND). Samples containing asbestos are identified in Table 1 by the asbestos content (percent asbestos) and emphasized using bold text.

Notes:

- ACM = Asbestos Containing Material (greater than 1% asbestos)
- ACCM = Asbestos Containing Construction Materials (greater than 0.1% asbestos)
- NA = Not applicable
- ND = Nondetect (i.e., no asbestos identified above the laboratory detection limit)
- PC400 = Point Count 400 (laboratory analytical method)
- RACM = Regulated Asbestos Containing Material (friable and greater than 1% asbestos)
- Individual materials comprising multi-layered samples are separated by a "+" sign

### **Conclusions for Asbestos**

As listed in Table 1, none (0) of the sampled materials were reported to contain asbestos. The location of the samples collected at the SH roof are shown on Figure 1 (Attachment A). Typical sampled materials are depicted in the attached photographs (Attachment B). The PLM laboratory analytical reports are attached (Attachment C).

Any suspect ACM not identified in this memorandum that is discovered during site work shall be presumed to contain >1% asbestos until sampled and proven otherwise. If suspect ACM is identified during construction for which there is no existing data, then work in that area shall stop, the material wetted, and access to the area restricted until the suspect ACM can be sampled, analyzed, and appropriately classified. If applicable, any asbestos material(s) discovered onsite during construction work shall be removed by a licensed abatement contractor prior to other work that may impact such material.

Material containing greater than 1% asbestos is classified by Cal/OSHA as ACM, while material containing less than 1% asbestos is classified as ACCM. Construction work impacting ACM and ACCM requires compliance with Cal/OSHA asbestos regulations (8CCR1529). Demolition and renovation work impacting ACM requires compliance with the USEPA NESHAP regulations as enforced locally by the North Coast Unified Air Quality Management District (NCUAQMD).

Nonfriable ACM is classified as nonhazardous asbestos waste, so long as the material is not rendered friable. If impacted using mechanical means, nonfriable ACM shall be understood to be rendered friable and reclassified as Regulated ACM (RACM). Friable material containing greater than one percent asbestos (RACM) is classified as a California hazardous waste.

## Lead Findings

The AAS data are summarized in Table 2 (below). Table 2 lists the sample location, material type, reported or presumed lead content, and associated regulatory designation for each sampled material.

| Sie<br>Sample<br>Number  | mens Hall (Building 00<br>Location          | 4) - Roof<br>Material   | Laboratory Result | Regulatory Designation |  |  |
|--|---|-------------------------|-------------------|------------------------|--|--|
| SH-Pb-01   | SH roof – vent pipe<br>at center-east       | Metal flashing (silver) | 240,000 ppm       | LBP                    |  |  |
| SH-Pb-02   | SH roof – HVAC vent<br>housing at southwest | Paint (grey)            | 54,000 ppm        | LBP                    |  |  |
| Notes:<br>• LBP = Lead Based Paint (greater than 5,000 parts per million or 0.5% lead by weight)<br>• LCP = Lead Containing Paint (containing >90 ppm lead)<br>• ppm = Parts per million |   |                         |                   |                        |  |  |

## **Conclusions for Lead**

As noted in Table 2, two (2) samples representing two (2) unique materials were reported to contain lead. Paint reported to contain lead in concentrations greater than 5,000 parts per million (ppm) or 0.5% by weight is classified as LBP, while paint containing any detectable amount of lead is classified as Lead Containing Paint (LCP). Typical examples of the lead material identified at SH is shown in the attached photographs (Attachment B). The AAS laboratory analytical reports are attached (Attachment C).

Based on the age of the building and data collected onsite, lead is known to be present at SH. All painted coatings and malleable vent pipe flashing at SH shall be presumed to contain lead unless sampled and proven otherwise. Construction work impacting known or presumed lead materials (e.g., LBP, LCP, etc.) must comply with applicable Cal/OSHA regulations (8CCR1532.1).

Demolition waste streams generated by construction work at SH must be representatively sampled to determine the total and soluble concentration of lead in the waste. Transportation and disposal requirements shall be determined based on the waste characterization data.

## Closing

If other hazardous constituents of concern are presumed to be present onsite beyond those identified in the memorandum, then additional sampling must be performed to evaluate the presence of such hazards. Waste streams generated during construction and/or demolition work at SH must be representatively sampled to determine the concentration of hazardous constituents in the waste prior to transport offsite.

Please contact FM PDC with any questions regarding the information contained in this memorandum.

Thank you,

Facilities Management - Planning, Design & Construction

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis . Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc San Leandro, CA NVLAP Lab Code 101048-3, WA C884

## **Notes and Definitions**

| Item      | Definition  |
|-----------|---|
| D         | Analyte was reported from a dilution run.   |
| (Dig)     | For metals analysis, sample was digested.   |
| [2C]      | Reported from the second channel in dual column analysis.   |
| DA        | Direct Analysis   |
| DF        | Dilution Factor   |
| MDL       | Method Detection Limit.   |
| ND        | Analyte was NOT DETECTED at or above the detection limit.   |
| NR        | Spike/Surrogate showed no recovery.   |
| Q         | Qualifier   |
| RCS       | Respirable Crystalline Silica   |
| RL        | Reporting Limit   |
|           | For paint chips, the RL is 0.008% by wt. (equiv. to 80 mg/kg, or ppm) based upon a minimum sample weight of 0.25 grams.                         |
|           | For soils, the RL is 40 mg/kg (ppm) based upon a minimum sample weight of 0.5 grams.  |
|           | For dust wipes, the RL is 10 µg/wipe; reporting units of µg/sq. ft. are not validated by the lab based upon data provided by non-lab personnel. |
| Wet       | Sample is not dry weight corrected.   |
| Measureme | nt of uncertainty and any applicable definitions of method modifications are available upon request. Per EPA NLLAP policy,                      |

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. QC sample results are within quality control criteria and met method specifications unless otherwise noted. All results for soil samples are reported on a dry weight basis, unless otherwise noted.

Analysis following EMSL SOP for the Determination of Environmental Lead by FLAA. The laboratory has a reporting limit of 0.0064% by wt., based upon a minimum sample weight of 0.25g submitted to the lab, and is not responsible for any result or reporting limit provided in mg/cm2 since it is dependent upon an area value provided by non-lab personnel. A "<" (less than) result signifies that the analyte was not detected at or above the reporting limit. Measurement of uncertainty and definitions of modifications are available upon request. Results in this report are not blank corrected unless specified.
